## Professional Summary

A final-year Information Science undergraduate with firsthand knowledge developing LLM applications, RAG systems, and developer productivity tools adept at using Python, LangChain and FastAPI to build AI-driven applications, with practical experience gained through internships, hackathons, and independent projects.

## Technical Skills

**Programming Languages |** Python (AI & Automation) • Java • C • SQL

**AI |** LLM Applications • RAG (Pipeline Development) • LangChain Framework • FAISS

**Web Development |** Node.js • FastAPI • HTML5 • CSS3

**Development Tools |** Git • GitHub • GitHub Actions • Pre commit Hooks

**Core Competencies |** Data Structures & Algorithms • Operating Systems • Computer Networks • Object Oriented Programming

## Work Experience

**Campus Ambassador Intern | Google Gemini** **May '26 – Present**

- Lead campus initiatives promoting Google Gemini and Generative AI, driving student engagement through workshops, outreach programs, and technical discussions on practical LLM applications.
- Collaborate with students, faculty, and program stakeholders to organize AI-focused events and knowledge-sharing sessions covering prompt engineering, RAG, and emerging AI technologies.
- Create educational content demonstrating practical Gemini use cases for career development, resume building, interview preparation, and productivity.

**AI Project Intern | Infosys Springboard Virtual Internship** **Dec '25 – Feb '26**

- Developed and tested AST-based Python modules to identify undocumented functions and classes, following clean-code practices and packaging the analysis engine as a reusable PyPI library.
- Automated documentation quality checks using Git pre-commit hooks and GitHub Actions, running validation before code merges.
- Built a Streamlit developer interface for real-time documentation reports, improving code-quality visibility and onboarding for contributors.

## Projects

**COSMOS - AI-Powered Mythology - Science Alignment Engine using RAG** **Apr '26 – Present**

- Built a RAG-based system that semantically aligns mythological narratives with scientific theories, using LangChain, Sentence Transformers, FAISS, and Groq-hosted LLMs to retrieve relevant concepts and generate comparisons.
- Added Pydantic-based output validation to maintain consistent responses and reduce unsupported or hallucinated claims.
- Designed retrieval-to-generation traceability, allowing users to verify generated comparisons against their source passages.

**Chrono Weather - AI Powered NASA Analog Forecasting System |** GitHub **Sept '25 – Nov '25**

- Built a full-stack climate forecasting platform using React.js, Node.js, and 7+ NASA REST APIs to analyse historical weather patterns and generate location-based insights from 40+ years of satellite data.
- Developed a historical analogue approach to identify similar past weather patterns and generate forecasts, with NASA source health monitoring.
- Added input validation and graceful fallbacks to keep the platform functional when individual NASA sources are unavailable.

**Automated Python Docstring Generator & Validator |** GitHub **Dec '25 – Feb '26**

- Built a full-stack developer tool using React and FastAPI that generates and validates Python docstrings through AST-based static analysis without executing user code.
- Automated PEP-257 documentation validation using pre-commit hooks, enabling real-time quality checks before code commits.
- Packaged the analysis engine as a pip-installable PyPI library with pinned dependencies and automated tests for reusable adoption.

## Education

**VidyaVardhaka College of Engineering | Mysuru, KA**

*Bachelor of Engineering, Information Science and Engineering • GPA: 8.52/10* Expected: 2027

## Achievements

- Emerged as a winner at Eurekathon 2025 (Coding Track) for building Chrono Weather, an AI-powered weather intelligence platform.
- Felicitated at Infosys Pragati: Path to Future - Springboard Summit 2025 for technical aptitude and leadership potential.
